INFERENCE IN FIRST-ORDER LOGIC

CHAPTER 9
Outline

◊ Reducing first-order inference to propositional inference
◊ Unification
◊ Generalized Modus Ponens
◊ Forward and backward chaining
◊ Logic programming
◊ Resolution
Universal instantiation (UI)

Every instantiation of a universally quantified sentence is entailed by it:

\[ \forall v \ \alpha \]
\[ \text{Subst}(\{v/g\}, \alpha) \]

for any variable \( v \) and ground term \( g \)

E.g., \( \forall x \ \ König(x) \land \ Greedy(x) \ \Rightarrow \ Evil(x) \) yields

\[ König(\text{John}) \land \ Greedy(\text{John}) \ \Rightarrow \ Evil(\text{John}) \]
\[ König(\text{Richard}) \land \ Greedy(\text{Richard}) \ \Rightarrow \ Evil(\text{Richard}) \]
\[ König(\text{Father(John)}) \land \ Greedy(\text{Father(John)}) \ \Rightarrow \ Evil(\text{Father(John)}) \]

\[ \vdots \]
Existential instantiation (EI)

For any sentence $\alpha$, variable $v$, and constant symbol $k$
that does not appear elsewhere in the knowledge base:

$$
\exists v \alpha \\
\text{Subst}\{v/k\}, \alpha
$$

E.g., $\exists x \ Crown(x) \land OnHead(x, John)$ yields

$$
\begin{align*}
\text{Crown}(C_1) & \land OnHead(C_1, John) \\
\text{provided } C_1 \text{ is a new constant symbol, called a Skolem constant}
\end{align*}
$$
Existential instantiation contd.

UI can be applied several times to *add* new sentences; the new KB is logically equivalent to the old.

EI can be applied once to *replace* the existential sentence; the new KB is *not* equivalent to the old, but is satisfiable iff the old KB was satisfiable.
Reduction to propositional inference

Suppose the KB contains just the following:

\[ \forall x \ King(x) \land Greedy(x) \Rightarrow Evil(x) \]
\[ King(John) \]
\[ Greedy(John) \]
\[ Brother(Richard, John) \]

Instantiating the universal sentence in all possible ways, we have

\[ King(John) \land Greedy(John) \Rightarrow Evil(John) \]
\[ King(Richard) \land Greedy(Richard) \Rightarrow Evil(Richard) \]
\[ King(John) \]
\[ Greedy(John) \]
\[ Brother(Richard, John) \]

The new KB is propositionalized: proposition symbols are

King(John), Greedy(John), Evil(John), King(Richard) etc.
Claim: a ground sentence* is entailed by new KB iff entailed by original KB

Claim: every FOL KB can be propositionalized so as to preserve entailment

Idea: propositionalize KB and query, apply resolution, return result

Problem: with function symbols, there are infinitely many ground terms, 
   e.g., $Father(Father(Father(John)))$

Theorem: Herbrand (1930). If a sentence $\alpha$ is entailed by an FOL KB, 
   it is entailed by a finite subset of the propositional KB

Idea: For $n = 0$ to $\infty$ do
   create a propositional KB by instantiating with depth-$n$ terms
   see if $\alpha$ is entailed by this KB

Problem: works if $\alpha$ is entailed, loops if $\alpha$ is not entailed

Theorem: Turing (1936), Church (1936), entailment in FOL is semidecidable
Problems with propositionalization

Propositionalization seems to generate lots of irrelevant sentences.
E.g., from

\[ \forall x \ King(x) \land Greedy(x) \Rightarrow Evil(x) \]
\[ King(John) \]
\[ \forall y \ Greedy(y) \]
\[ Brother(Richard, John) \]

it seems obvious that \( Evil(John) \), but propositionalization produces lots of facts such as \( Greedy(Richard) \) that are irrelevant

With \( p \) \( k \)-ary predicates and \( n \) constants, there are \( p \cdot n^k \) instantiations!
Unification

We can get the inference immediately if we can find a substitution \( \theta \) such that \( \text{King}(x) \) and \( \text{Greedy}(x) \) match \( \text{King}(\text{John}) \) and \( \text{Greedy}(y) \)

\[ \theta = \{ x/\text{John}, y/\text{John} \} \text{ works} \]

\( \text{UNIFY}(\alpha, \beta) = \theta \) if \( \alpha \theta = \beta \theta \)

<table>
<thead>
<tr>
<th>( p )</th>
<th>( q )</th>
<th>( \theta )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \text{Knows}(\text{John}, x) )</td>
<td>( \text{Knows}(\text{John}, \text{Jane}) )</td>
<td></td>
</tr>
<tr>
<td>( \text{Knows}(\text{John}, x) )</td>
<td>( \text{Knows}(y, \text{OJ}) )</td>
<td></td>
</tr>
<tr>
<td>( \text{Knows}(\text{John}, x) )</td>
<td>( \text{Knows}(y, \text{Mother}(y)) )</td>
<td></td>
</tr>
<tr>
<td>( \text{Knows}(\text{John}, x) )</td>
<td>( \text{Knows}(x, \text{OJ}) )</td>
<td></td>
</tr>
</tbody>
</table>
Unification

We can get the inference immediately if we can find a substitution $\theta$ such that $\text{King}(x)$ and $\text{Greedy}(x)$ match $\text{King}(\text{John})$ and $\text{Greedy}(y)$

$\theta = \{x/\text{John}, y/\text{John}\}$ works

$\text{UNIFY}(\alpha, \beta) = \theta$ if $\alpha\theta = \beta\theta$

<table>
<thead>

<tr>
<td>$\text{Knows}(\text{John}, x)$</td>
<td>$\text{Knows}(x, \text{OJ})$</td>
<td></td>
</tr>
</tbody>
</table>
### Unification

We can get the inference immediately if we can find a substitution $\theta$ such that $King(x)$ and $Greedy(x)$ match $King(John)$ and $Greedy(y)$

$$\theta = \{x/John, y/John\} \text{ works}$$

$\text{UNIFY}(\alpha, \beta) = \theta$ if $\alpha \theta = \beta \theta$

<table>
<thead>
<tr>
<th>$p$</th>
<th>$q$</th>
<th>$\theta$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$Knows(John, x)$</td>
<td>$Knows(John, Jane)$</td>
<td>${x/Jane}$</td>
</tr>
<tr>
<td>$Knows(John, x)$</td>
<td>$Knows(y, OJ)$</td>
<td>${x/OJ, y/John}$</td>
</tr>
<tr>
<td>$Knows(John, x)$</td>
<td>$Knows(y, Mother(y))$</td>
<td>${y/John, x/Mother(John)}$</td>
</tr>
<tr>
<td>$Knows(John, x)$</td>
<td>$Knows(x, OJ)$</td>
<td>fail</td>
</tr>
</tbody>
</table>

**Standardizing apart** eliminates overlap of variables, e.g., $Knows(z_{17}, OJ)$
Generalized Modus Ponens (GMP)

\[ p_1', p_2', \ldots, p_n', (p_1 \land p_2 \land \ldots \land p_n \Rightarrow q) \quad q\theta \]

where \( p_i'\theta = p_i\theta \) for all \( i \)

\( p_1' \) is \( King(John) \) \quad \( p_1 \) is \( King(x) \)
\( p_2' \) is \( Greedy(y) \) \quad \( p_2 \) is \( Greedy(x) \)
\( \theta \) is \( \{x/John, y/John\} \) \quad \( q \) is \( Evil(x) \)
\( q\theta \) is \( Evil(John) \)

GMP used with KB of definite clauses (\textit{exactly} one positive literal)
All variables assumed universally quantified
Soundness of GMP

Need to show that

\[ p_1', \ldots, p_n', (p_1 \land \ldots \land p_n \Rightarrow q) \models q\theta \]

provided that \( p_i'\theta = p_i\theta \) for all \( i \)

Lemma: For any definite clause \( p \), we have \( p \models p\theta \) by UI

1. \( (p_1 \land \ldots \land p_n \Rightarrow q) \models (p_1 \land \ldots \land p_n \Rightarrow q)\theta = (p_1\theta \land \ldots \land p_n\theta \Rightarrow q\theta) \)

2. \( p_1', \ldots, p_n' \models p_1' \land \ldots \land p_n' \models p_1'\theta \land \ldots \land p_n'\theta \)

3. From 1 and 2, \( q\theta \) follows by ordinary Modus Ponens
The law says that it is a crime for an American to sell weapons to hostile nations. The country Nono, an enemy of America, has some missiles, and all of its missiles were sold to it by Colonel West, who is American.

Prove that Col. West is a criminal
Example knowledge base contd.

... it is a crime for an American to sell weapons to hostile nations:
Example knowledge base contd.

... it is a crime for an American to sell weapons to hostile nations:

\[ \text{American}(x) \land \text{Weapon}(y) \land \text{Sells}(x, y, z) \land \text{Hostile}(z) \implies \text{Criminal}(x) \]

Nono ... has some missiles
... it is a crime for an American to sell weapons to hostile nations:

\[ \text{American}(x) \land \text{Weapon}(y) \land \text{Sells}(x, y, z) \land \text{Hostile}(z) \Rightarrow \text{Criminal}(x) \]

Nono ... has some missiles, i.e., \( \exists x \ \text{Owns}(\text{Nono}, x) \land \text{Missile}(x) \):

\[ \text{Owns}(\text{Nono, } M_1) \text{ and } \text{Missile}(M_1) \]

... all of its missiles were sold to it by Colonel West
Example knowledge base contd.

... it is a crime for an American to sell weapons to hostile nations:

\[ \text{American}(x) \land \text{Weapon}(y) \land \text{Sells}(x, y, z) \land \text{Hostile}(z) \Rightarrow \text{Criminal}(x) \]

Nono ... has some missiles, i.e., \( \exists x \ \text{Owns}(\text{Nono}, x) \land \text{Missile}(x) \):

\[ \text{Owns}(\text{Nono}, M_1) \ \text{and} \ \text{Missile}(M_1) \]

... all of its missiles were sold to it by Colonel West

\[ \forall x \ \text{Missile}(x) \land \text{Owns}(\text{Nono}, x) \Rightarrow \text{Sells}(\text{West}, x, \text{Nono}) \]

Missiles are weapons:
Example knowledge base contd.

... it is a crime for an American to sell weapons to hostile nations:
\[ \text{American}(x) \land \text{Weapon}(y) \land \text{Sells}(x, y, z) \land \text{Hostile}(z) \Rightarrow \text{Criminal}(x) \]

Nono ... has some missiles, i.e., \( \exists x \, \text{Owns}(\text{Nono}, x) \land \text{Missile}(x) \):
\[ \text{Owns}(\text{Nono}, M_1) \, \text{and} \, \text{Missile}(M_1) \]

... all of its missiles were sold to it by Colonel West
\[ \forall x \, \text{Missile}(x) \land \text{Owns}(\text{Nono}, x) \Rightarrow \text{Sells}(\text{West}, x, \text{Nono}) \]

Missiles are weapons:
\[ \text{Missile}(x) \Rightarrow \text{Weapon}(x) \]

An enemy of America counts as “hostile”:
... it is a crime for an American to sell weapons to hostile nations:

\[ \text{American}(x) \land \text{Weapon}(y) \land \text{Sells}(x, y, z) \land \text{Hostile}(z) \Rightarrow \text{Criminal}(x) \]

Nono ... has some missiles, i.e., \( \exists x \ \text{Owns}(\text{Nono}, x) \land \text{Missile}(x) \):

\( \text{Owns}(\text{Nono}, M_1) \) and \( \text{Missile}(M_1) \)

... all of its missiles were sold to it by Colonel West

\( \forall x \ \text{Missile}(x) \land \text{Owns}(\text{Nono}, x) \Rightarrow \text{Sells}(\text{West}, x, \text{Nono}) \)

Missiles are weapons:

\( \text{Missile}(x) \Rightarrow \text{Weapon}(x) \)

An enemy of America counts as "hostile":

\( \text{Enemy}(x, \text{America}) \Rightarrow \text{Hostile}(x) \)

West, who is American ...

\( \text{American}(\text{West}) \)

The country Nono, an enemy of America ...

\( \text{Enemy}(\text{Nono}, \text{America}) \)
Forward chaining algorithm

```
function FOL-FC-Ask(KB, α) returns a substitution or false

repeat until new is empty
  new ← {}
  for each sentence r in KB do
    (p₁ ∧ ... ∧ pₙ ⇒ q) ← STANDARDIZE-APART(r)
    for each θ such that (p₁ ∧ ... ∧ pₙ)θ = (p₁' ∧ ... ∧ pₙ')θ
      for some p₁', ..., pₙ' in KB
        q' ← SUBST(θ, q)
        if q' is not a renaming of a sentence already in KB or new then do
          add q' to new
          φ ← UNIFY(q', α)
          if φ is not fail then return φ
    add new to KB
  return false
```
Forward chaining proof

American(West)  Missile(M1)  Owns(Nono,M1)  Enemy(Nono,America)
Forward chaining proof
Forward chaining proof

- Criminal(West)
  - Weapon(M1)
  - Sells(West,M1,Nono)
  - Hostile(Nono)
    - American(West)
    - Missile(M1)
    - Owns(Nono,M1)
    - Enemy(Nono,America)
Properties of forward chaining

Sound and complete for first-order definite clauses
(proof similar to propositional proof)

Datalog = first-order definite clauses + no functions (e.g., crime KB)
FC terminates for Datalog in poly iterations: at most $p \cdot n^k$ literals

May not terminate in general if $\alpha$ is not entailed

This is unavoidable: entailment with definite clauses is semidecidable
Efficiency of forward chaining

Simple observation: no need to match a rule on iteration $k$
if a premise wasn’t added on iteration $k - 1$

$\Rightarrow$ match each rule whose premise contains a newly added literal

Matching itself can be expensive

**Database indexing** allows $O(1)$ retrieval of known facts
  e.g., query $\text{Missile}(x)$ retrieves $\text{Missile}(M_1)$

Matching conjunctive premises against known facts is NP-hard

Forward chaining is widely used in **deductive databases**
Hard matching example

\[
\begin{align*}
\text{Diff}(\text{wa}, \text{nt}) & \wedge \text{Diff}(\text{wa}, \text{sa}) \wedge \\
\text{Diff}(\text{nt}, \text{q}) & \text{Diff}(\text{nt}, \text{sa}) \wedge \\
\text{Diff}(\text{q}, \text{nsw}) & \text{Diff}(\text{q}, \text{sa}) \wedge \\
\text{Diff}(\text{nsw}, \text{v}) & \text{Diff}(\text{nsw}, \text{sa}) \wedge \\
\text{Diff}(\text{v}, \text{sa}) & \Rightarrow \text{Colorable}() \\
\text{Diff}(\text{Red}, \text{Blue}) & \text{Diff}(\text{Red}, \text{Green}) \\
\text{Diff}(\text{Green}, \text{Red}) & \text{Diff}(\text{Green}, \text{Blue}) \\
\text{Diff}(\text{Blue}, \text{Red}) & \text{Diff}(\text{Blue}, \text{Green})
\end{align*}
\]

\textit{Colorable()} is inferred iff the CSP has a solution

CSPs include 3SAT as a special case, hence matching is NP-hard
function FOL-BC-Ask(KB, goals, θ) returns a set of substitutions
  inputs: KB, a knowledge base
          goals, a list of conjuncts forming a query
          θ, the current substitution, initially the empty substitution { }
  local variables: ans, a set of substitutions, initially empty
  if goals is empty then return {θ}
  q' ← Subst(θ, First(goals))
  for each r in KB where Standardize-Apart(r) = (p₁ ∧ ... ∧ pₙ ⇒ q)
  and θ' ← Unify(q, q') succeeds
  ans ← FOL-BC-Ask(KB, [p₁, ..., pₙ] | Rest(goals)|, Compose(θ', θ)) ∪ ans
  return ans
Backward chaining example

*Criminal(West)*

- Weapon(y)
- Sells(x,y,z)
- Hostile(z)
Backward chaining example

- **Hostile(z)**
- **Criminal(West)**
- **Sells(x,y,z)**
- **Weapon(y)**
- **American(West)**
- **Missile(y)**
- **{ }**

\{x/West\}
Backward chaining example

```
Criminal(West) \{x/West, y/M1\}

American(West)
{}  

Weapon(y)  

Sells(x,y,z)

Hostile(z)

Missile(y)
{}  \{y/M1\}
```
Backward chaining example

Criminal(West) \{x/West, y/M1, z/Nono\}

American(West) \{\}

Weapon(y) \{\}

Sells(West,M1,z) \{z/Nono\}

Missile(y) \{y/M1\}

Missile(M1)

Owns(Nono,M1)

Hostile(z)
Backward chaining example

Hostile(Nono)  
Enemy(Nono, America)  
Owns(Nono, M1)  
Missile(M1)

Criminal(West)  
x/West, y/M1, z/Nono

American(West)  
Weapon(y)  
Sells(West, M1, z)  
Hostile(Nono)

Missile(y)  
y/M1
Missile(M1)  
Owns(Nono, M1)

Enemy(Nono, America)  
{ }  
{ z/Nono }  
{ }  
{ }
Properties of backward chaining

Depth-first recursive proof search: space is linear in size of proof

Incomplete due to infinite loops
  \Rightarrow \text{ fix by checking current goal against every goal on stack}

Inefficient due to repeated subgoals (both success and failure)
  \Rightarrow \text{ fix using caching of previous results (extra space!)}

Widely used (without improvements!) for logic programming

Logic programming: computation as inference on logical KBs
Prolog systems

Basis: backward chaining with Horn clauses + bells & whistles
Widely used in Europe, Japan (basis of 5th Generation project)

Program = set of clauses = head :- literal$_1$, ... literal$_n$.

   criminal(X) :- american(X), weapon(Y), sells(X,Y,Z), hostile(Z).

Efficient unification by open coding
Efficient retrieval of matching clauses by direct linking
Depth-first, left-to-right backward chaining
Built-in predicates for arithmetic etc., e.g., X is Y*Z+3
Closed-world assumption ("negation as failure")
   e.g., given alive(X) :- not dead(X).
   alive(joe) succeeds if dead(joe) fails
Prolog example

Appending two lists to produce a third:

append([], Y, Y).
append([X|L], Y, [X|Z]) :- append(L, Y, Z).

query: append(A, B, [1, 2]) ?
answers: A=[] B=[1, 2]
         A=[1, 2] B=[]
Resolution: brief summary

Full first-order version:

\[
\frac{\ell_1 \lor \cdots \lor \ell_k, \quad m_1 \lor \cdots \lor m_n}{(\ell_1 \lor \cdots \lor \ell_{i-1} \lor \ell_{i+1} \lor \cdots \lor \ell_k \lor m_1 \lor \cdots \lor m_{j-1} \lor m_{j+1} \lor \cdots \lor m_n)\theta}
\]

where \(\text{UNIFY}(\ell_i, \neg m_j) = \theta\).

For example,

\[
\frac{-\text{Rich}(x) \lor \text{Unhappy}(x)}{\text{Rich}(Ken)} \quad \frac{\text{Unhappy}(Ken)}{\phi(x)}
\]

with \(\theta = \{x/\text{Ken}\}\)

Apply resolution steps to \(\text{CNF}(KB \land \neg \alpha)\); complete for FOL
Conversion to CNF

Everyone who loves all animals is loved by someone:
\[ \forall x \ [ \forall y \ Animal(y) \Rightarrow Loves(x, y)] \Rightarrow [\exists y \ Loves(y, x)] \]

1. Eliminate biconditionals and implications

\[ \forall x \ [ \neg \forall y \ \neg Animal(y) \lor Loves(x, y)] \lor [\exists y \ Loves(y, x)] \]

2. Move \( \neg \) inwards: \( \neg \forall \ x, p \equiv \exists x \ \neg p \), \( \neg \exists \ x, p \equiv \forall x \ \neg p \):

\[ \forall x \ [ \exists y \ \neg (\neg Animal(y) \lor Loves(x, y))] \lor [\exists y \ Loves(y, x)] \]
\[ \forall x \ [\exists y \ \neg \neg Animal(y) \land \neg Loves(x, y)] \lor [\exists y \ Loves(y, x)] \]
\[ \forall x \ [\exists y \ Animal(y) \land \neg Loves(x, y)] \lor [\exists y \ Loves(y, x)] \]
Conversion to CNF contd.

3. Standardize variables: each quantifier should use a different one

\[ \forall x \ [\exists y \ Animal(y) \land \neg Loves(x, y)] \lor [\exists z \ Loves(z, x)] \]

4. Skolemize: a more general form of existential instantiation.
   Each existential variable is replaced by a Skolem function
   of the enclosing universally quantified variables:

\[ \forall x \ [Animal(F(x)) \land \neg Loves(x, F(x))] \lor Loves(G(x), x) \]

5. Drop universal quantifiers:

\[ [Animal(F(x)) \land \neg Loves(x, F(x))] \lor Loves(G(x), x) \]

6. Distribute \( \lor \) over \( \land \):

\[ [Animal(F(x)) \lor Loves(G(x), x)] \land [\neg Loves(x, F(x)) \lor Loves(G(x), x)] \]
Resolution proof: definite clauses
