1. [100 points] Obtain at least 100 text documents belonging to at least two classes and apply the Naive Bayes algorithm for text classification to the documents. You should use ten-fold cross-validation and report the results. To obtain the documents you may use old news group data from Tom Mitchell’s cite below, some web queries or any method of your choice as long as you clearly describe it. You can use the code provided by Tom Mitchell which can be downloaded from http://www.cs.cmu.edu/afs/cs/project/theo-11/www/naive-bayes.html or any code or package that supports text classification (WEKA does) or write your own code. If you use or write a code other than Tom Mitchell’s, please provide me with the code and documentation.
