

CSCI: 4500/6500 Programming Languages

Scripting Languages Chapter 13

Maria Hybinette, UGA

Thanks to Kathleen Fisher, AT & T Research Labs

1

What is Scripting?

- Name comes from written **script** such as screenplay, where dialog is repeated verbatim for every performance

Maria Hybinette, UGA

2

Origin of Scripting Languages

- Scripting languages originated as **job control languages**
 - 1960s: IBM System 360 had the Job Control Language (JCL)
 - Scripts used to control other programs
 - Launch compilation, execution
 - Check return codes
- Scripting languages evolved in the UNIX world
 - Shell programming: AWK, Tcl/Tk, Perl
 - Scripts used to combine component ("programming in the large")
 - Gluing applications [Ousterhout 97]

Glue that puts components together

Maria Hybinette, UGA

3

Higher-level Programming

- Scripting languages provide an even higher-level of abstraction
 - The main goal is **programming productivity**
 - Performance is a secondary consideration
 - Modern SL provide primitive operations with greater functionality
- Scripting languages are **usually** interpreted
 - Interpretation increases speed of development
 - Immediate feedback
 - Compilation to an intermediate format is common (e.g. Perl)

Maria Hybinette, UGA

4

Contemporary Scripting Languages

- Unix shells: sh, ksh, bash
 - job control
- Perl
 - Slashdot, bioinformatics, financial data processing, CGI
- Python
 - System administration at Google
- Ruby
 - Various blogs, data processing applications
- PHP
 - Yahoo web site
- JavaScript
 - Google maps

KORNSHELL

Maria Hybinette, UGA

5

What is Scripting Language Again?

- Favor rapid development over efficiency of execution
 - Code can be developed 5-10 times faster in a scripting language but will run at a 10th/20th of the speed of a systems language such as C, C++ [Ousterhout]
- Coordinates multiple programs
 - Strong at communicating with program components written in other languages
- Hard to put a finger on -- difficult to define **exactly** what makes language a scripting language

Maria Hybinette, UGA

6

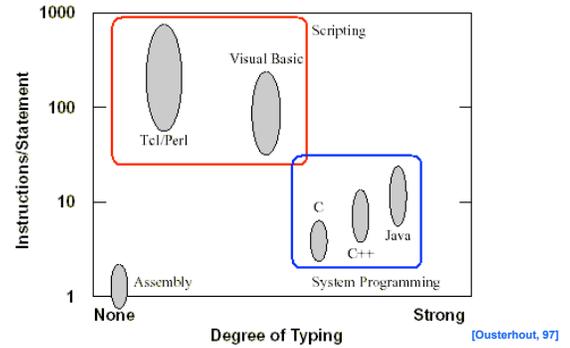

Common Characteristics

- Batch and interactive use
- Economy of expression (readability?)
- **Weakly** typed
 - » meaning is inferred (no declaration required)
 - » => less error checking at compile time
 - run time checking is less efficient (strict run type checking by Python, Ruby, Scheme).
 - » Increases speed of *development*
 - more flexible
 - fewer lines of code
- High-level model of underlying machines
- Easy access to other programs
- Sophisticated pattern matching and string manipulation
- High-level data types (sets, bags, lists, dictionaries and tuples)

Maria Hybinetta, UGA

7

Typing and Productivity

Maria Hybinetta, UGA

8

Design Philosophy

Often people, especially computer engineers, focus on the machines. They think,

"By doing this, the machine will run faster.

By doing this, the machine will run more effectively.

By doing this, the machine will do something something something."

They are focusing on the machines. But in fact we need to focus on humans, on how humans care about doing programming or operating the application of the machines. We are the masters. They are the slaves.

Yukihiro "Matz" Matsumoto
Creator of Ruby

Maria Hybinetta, UGA

9

Application Domains

- Shell scripts
- Macro
- Application specific
- Web programming
- Text processing
- Extension/Embedded
- Others

Maria Hybinetta, UGA

Number	Name	PDF
1	Homework 1 (due 01/10)	PDF
2	Homework 2 (due 01/31)	PDF
3a	Homework 3a (due 02/07)	PDF
3	Homework 3 (due 02/15)	PDF
4	Homework 4 (due 03/09)	PDF
5	Homework 5 (due 03/30)	PDF
6	Homework 6 (due 04/13)	PDF

Demo: Getting due dates of homework

- What if I don't want to go to the web site to see if I have CSCI 4500/6500 homework?
- Write a script to check for me!

```
{saffron} check http://www.cs.uga.edu/~maria/classes/4500-Spring-2006/4500-hw.html
Bwk 6 is due on Thursday, April 13.
Bwk 1 was due on Tuesday, January 10.
Bwk 2 was due on Tuesday, January 31.
Bwk 3 was due on Wednesday, February 15.
Bwk 4 is due on Thursday, March 09.
Bwk 5 is due on Thursday, March 30.
```

Maria Hybinetta, UGA

12

“Shebang”

```
#!/usr/bin/ruby
require 'uri'; require 'net/http'

uri= URI.parse( ARGV[0] )
h=Net::HTTP.new(uri.host,80)

resp_data = h.get(uri.path)
hwk = {}
if resp.message == "OK"
  data.scan(/Homework (\d*) \(\text{due } (\d*) \\\ (\d*) \\\) \\\
           [|x,y,z| hwk[x] = Time.local(2006,y,z)
end

hwk.each{| assignment, duedate|
  if duedate < (Time.now - 60 * 60 * 24)
    puts "Hwk #{assignment} was due on #{duedate.strftime("%A, %B %d")}."
  else
    puts "Hwk #{assignment} is due on #{duedate.strftime("%A, %B %d")}."
  end
}
```

```
#!/usr/bin/ruby
require 'uri'; require 'net/http'

uri= URI.parse( ARGV[0] )
h=Net::HTTP.new(uri.host,80)

resp_data = h.get(uri.path)
hwk = {}
if resp.message == "OK"
  data.scan(/Homework (\d*) \(\text{due } (\d*) \\\ (\d*) \\\) \\\
           [|x,y,z| hwk[x] = Time.local(2006,y,z)
end

hwk.each{| assignment, duedate|
  if duedate < (Time.now - 60 * 60 * 24)
    puts "Hwk #{assignment} was due on #{duedate.strftime("%A, %B %d")}."
  else
    puts "Hwk #{assignment} is due on #{duedate.strftime("%A, %B %d")}."
  end
}
```

useful libraries

```
#!/usr/bin/ruby
require 'uri'; require 'net/http'

uri = URI.parse( ARGV[0] )
h = Net::HTTP.new(uri.host,80)

resp_data = h.get(uri.path)
hwk = {}
if resp.message == "OK"
  data.scan(/Homework (\d*) \(\text{due } (\d*) \\\ (\d*) \\\) \\\
           [|x,y,z| hwk[x] = Time.local(2006,y,z)
end

hwk.each{| assignment, duedate|
  if duedate < (Time.now - 60 * 60 * 24)
    puts "Hwk #{assignment} was due on #{duedate.strftime("%A, %B %d")}."
  else
    puts "Hwk #{assignment} is due on #{duedate.strftime("%A, %B %d")}."
  end
}
```

Powerful regular expression support

```
#!/usr/bin/ruby
require 'uri'; require 'net/http'

uri = URI.parse( ARGV[0] )
h = Net::HTTP.new(uri.host,80)

resp_data = h.get(uri.path)
hwk = {}
if resp.message == "OK"
  data.scan(/Homework (\d*) \(\text{due } (\d*) \\\ (\d*) \\\) \\\
           [|x,y,z| hwk[x] = Time.local(2006,y,z)
end

hwk.each{| assignment, duedate|
  if duedate < (Time.now - 60 * 60 * 24)
    puts "Hwk #{assignment} was due on #{duedate.strftime("%A, %B %d")}."
  else
    puts "Hwk #{assignment} is due on #{duedate.strftime("%A, %B %d")}."
  end
}
```

Associative arrays

```
#!/usr/bin/ruby
require 'uri'; require 'net/http'

uri = URI.parse( ARGV[0] )
h = Net::HTTP.new(uri.host,80)

resp_data = h.get(uri.path)
hwk = {}
if resp.message == "OK"
  data.scan(/Homework (\d*) \(\text{due } (\d*) \\\ (\d*) \\\) \\\
           [|x,y,z| hwk[x] = Time.local(2006,y,z)
end

hwk.each{| assignment, duedate |
  if duedate < (Time.now - 60 * 60 * 24)
    puts "Hwk #{assignment} was due on #{duedate.strftime("%A, %B %d")}."
  else
    puts "Hwk #{assignment} is due on #{duedate.strftime("%A, %B %d")}."
  end
}
```

String processing

```
#!/usr/bin/ruby
require 'uri'; require 'net/http'

uri = URI.parse( ARGV[0] )
h = Net::HTTP.new(uri.host,80)

resp_data = h.get(uri.path)
hwk = {}
if resp.message == "OK"
  data.scan(/Homework (\d*) \(\text{due } (\d*) \\\ (\d*) \\\) \\\
           [|x,y,z| hwk[x] = Time.local(2006,y,z)
end

hwk.each{| assignment, duedate|
  if duedate < (Time.now - 60 * 60 * 24)
    puts "Hwk #{assignment} was due on #{duedate.strftime("%A, %B %d")}."
  else
    puts "Hwk #{assignment} is due on #{duedate.strftime("%A, %B %d")}."
  end
}
```

Shebang

- In Unix systems, shebang tells the OS how to evaluate an executable text file.
 - » Shebang: sharp bang or haSH bang, referring to the two typical UNIX names of the two characters.

```
doit:
#! interp-path
prog-text
> ./doit args
```

→

```
> interp-path doit args
```

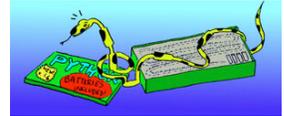

- **Advantages:** Don't need file extensions, program looks built-in, and can change implementation transparently.

Maria Hybinetta, UGA

19

Large Standard Library

- Date, ParseDate
- File
- getoptLong: processing command line switches
- profile: automatic performance profiling
- BasicSocket, IPSocket, TCPSocket, TCPSTerver, UDPSocket, Socket
- Net::FTP, Net::HTTP, Net::HTTPResponse, Net::POPMail, Net::SMTP, Net::Telnet
- CGI: cookies, session management
- Threads
- Matrix

Maria Hybinetta, UGA

20

Contributing users

- Ruby Application Archive (RAA)
 - » <http://raa.ruby-lang.org/>
 - » 144 library categories, 833 libraries available
 - » eg: URI library, database access
- Comprehensive Perl Archive Network (CPAN)
 - » <http://www.cpan.org/>
 - » 8853 Perl modules from 4655 authors
 - » "With Perl, you usually don't have to write much code: just find the code that somebody else has already written to solve your problem."

Maria Hybinetta, UGA

21

Example: URI and HTTP Libraries

```
require 'uri'; require 'net/http'
uri = URI.parse(ARGV[0])
h = Net::HTTP.new(uri.host,80)
resp,data = h.get(uri.path)
```

Require clauses cause Ruby to load named libraries.

Maria Hybinetta, UGA

22

Example: URI and HTTP Libraries

```
require 'uri'; require 'net/http'
uri = URI.parse(ARGV[0])
h = Net::HTTP.new(uri.host,80)
resp,data = h.get(uri.path)
```

URI.parse converts argument string into uri object, with host and path component (and more)

Maria Hybinetta, UGA

23

Example: URI and HTTP Libraries

```
require 'uri'; require 'net/http'
uri = URI.parse(ARGV[0])
h = Net::HTTP.new(uri.host,80)
resp,data = h.get(uri.path)
```

Net::HTTP.new creates an http connection object, ready to converse with the specified host on the indicated port.

Maria Hybinetta, UGA

24

Example: URI and HTTP Libraries

```
require 'uri'; require 'net/http'
uri = URI.parse(ARGV[0])
h = Net::HTTP.new(uri.host,80)
resp,data = h.get(uri.path)
```

`h.get` asks to retrieve the headers and content of the given path from the site associated with `h`. It returns response code and the payload data

Strings

- Strings are just objects:

```
"simon".length yields 8
```

- Strings can include expressions with # operator:

```
"3 + 4 = #{3 + 4}" yields "3 + 4 = 7"
```

- Plus operator concatenates strings:

```
"Simon" + "Cowell" yields "Simon Cowell"
```

- Many more operations (more than 75!).

Powerful regular expressions

- Regular expressions are patterns that match against strings, possibly creating bindings in the process. **Uses greedy matching.**
- In Ruby, regular expressions are **objects** created with special literal forms:

```
/reg-exp/ OR %r{reg-exp}
```

- Examples:

```
/arr/ matches strings containing arr
/\s*\|\s*/ matches a | with optional white space
```

Simple Matches

All characters except `. | () [\ ^ { + $ * ?` match themselves

<code>. () [\ ^ { + \$ * ?</code>	Precede by <code>\</code> to match directly
<code>.</code>	Matches any character
<code>[characters]</code>	Matches any single character in [...] May include ranges; Initial <code>^</code> negates
<code>\d</code>	Matches any digit
<code>\w</code>	Matches any "word" character
<code>\s</code>	Matches any whitespace
<code>^</code>	Matches the beginning of a line
<code>\$</code>	Matches the end of a line

Compound matches

<code>re*</code>	Matches 0 or more occurrences of re.
<code>re+</code>	Matches 1 or more occurrences of re.
<code>re{m,n}</code>	Matches at least m and no more than n occurrences of re.
<code>re?</code>	Matches zero or one occurrence of re.
<code>re1 re2</code>	Matches either re1 or re2
<code>(...)</code>	Groups regular expressions and directs interpreter to introduce bindings for intermediate results.

Bindings

Matching a string against a regular expression causes interpreter to introduce bindings:

<code>\$^</code>	Portion of string that preceded match.
<code>\$&</code>	Portion of string that matched.
<code>\$'</code>	Portion of string after match.
<code>\$1, \$2, ...</code>	Portion of match within <i>i</i> th set of parentheses.
